# Access to parking areas via remote control signal

Prima's remote control reader operates in the same way as an ordinary online reader. The system requires a remote control reader, an antenna and a remote control to make it possible to open gates or parking barriers from a distance. It is possible for the driver to open a gate or parking barrier via the signal from the remote control within a 15-20 metres distance depending on the conditions.

## Advantages of a remote control reader

- Functions as an online reader
- The reader is connected to an antenna that then acts as receiver for the remote control signal
- A single touch on the remote control opens the preprogrammed gate or parking barrier
- The antenna has a range of up to 15-20 metres depending on the conditions
- The remote control has 4 buttons, which can be set to 4 separate access areas and specific timeframes. The access rights are set in the Nova software
- The parking solution can be combined with traffic light control to secure easy access to underground parking
